The invention relates to producing a plant having increased disease resistance, comprising providing a non-naturally occurring plant cell over-expressing a polyuncleotide encoding a calcium dependent protein kinase (CDPK) polypeptide and regenerating a plant from the plant cell, where the CDPK polypeptide is expressed in the plant, increasing the resistance of the plant to disease as compared to a plant increasing naturally-occurring plant. The method is useful for a variety of agricultural and commercial purposes including improving a plant's

crosstance against plant pathogens, increasing crop yields, improving crop and ornamental quality and reducing agricultural production costs.

The method facilitates an effective and economical method for in-plant protection against plant pathogen, reducing or minimising the need for traditional chemical practices (e.g. application of fungicides, conficiency insecticides, or viricides) that are typically used by farmers for controlling the spread of plant pathogens and providing protection against disease causing pathogens. The method contributes to the production of high quality and high yield agricultural providing protects, e.g. fruits, ornamentals, vegetables, cereals and field crops pathogens, agricultural products with increased shelf-life and reduced handling costs and high quality and yield crops for agricultural (e.g. cereal and field crops), industrial (e.g. oilseeds) and commercial (e.g. cereal and field crops), industrial (e.g. oilseeds) and commercial (e.g. fiber crops) purposes. The present sequence is that of Abrabidopsis thaliana CDPK4 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               1,

This invention describes a novel nucleic acid molecule and its encoded protein that are induced upon pathogen invasion or elicitor treatment. The products of the invention are functional in plants, plant tissue and in plant cells for inducible gene expression and altering the disease resistance phenotype of plants. The products of the invention are related to calcium dependent protein kinase (CDPK) genes. The invention describes the isolation of a novel tobacco CDPK protein fragment and its encoding nucleic acid, isolated from a cell suspension culture derived from a tobacco cultivar KT14 explant, after growth in the presence of the elicitin paramiticein. This sequence represents the soybean CDPK protein which is used in the description of the method.
                                                                                                                                                                                                                                                 CDPK, calcium dependent protein kinase; tobacco; pathogen; invasion; induction; elicitor; plant; disease resistance; parasiticein; soybean; elicitin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotides based on calcium dependent protein kinase genes - useful to induce disease resistance in plants

Sequences AAM52842 represent novel protein kinase stress-related proteins (PKSRPS) from the moss Physcomirella patens, and sequences ABA91081 represent full-length cDNAs encoding them. The CDNA sequences were obtained from expressed sequence tags (ESTS; ABA91056-ABA91056-ABA91068) derived from Physcomirella patens cDNA libraries The PKSRPs of the invention comprise protein kinase-6 (PK-6), protein kinase-8 (PK-7), protein kinase-8 (PK-8), protein kinase-17 (PK-7), protein kinase-8 (PK-8), protein kinase-17 (PK-7), protein kinase-18 (PK-8), protein kinase-18 (PK-7), mitogen-activated protein (MAP) kinase-18 (PK-5), casein kinase-18 (PK-7), mitogen-activated protein (MAP) kinase-18 (PK-7), MAP kinase-19 (PK-8), and calcium-dependent protein kinase-19 (PK-1), and calcium-dependent protein tinase-19 (PK-1), and calcium-dependent protein transgrauze-19 (PK-1), and calcium-dependent protein protein patents and sedds with increased to generate to confer transgenic plants and sedds with increased tolerance to salinity, drought cand are especially maize, wheat, rye, oat, triticale, rice, barley, cotton, rapesed, cassava, sunflower, tagetes, leguminous plants (e.g., sophean, peanut, Vicia species, alfalfa), solanaceous plants (e.g., sophean, peanut, vicia species, alfalfa), solanaceous plants (e.g., potato, tobacco, and are sayerian, peenmilal grasses and forage crops. The panner panner and as markers for specific regions of the panner panner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241

Using plant protoplast expression systems for rapidly screening libraries of nucleic acids to identify gene that modulate expression of target genes -

Examples; Fig 3B; 95pp; English.

The invention provides a high through-put assay for rapidly screening a library of nucleic acid molecules to identify a gene product that modulates expression of a gene of interest in plant protoplasts. The

```
(a) reporter gene construct operably linked to a promoter of a gene of interest, and (b) a member of a library of nucleic acid molecules (the library control of the molecules (the library member is expressed in the plant protoplasts), and (2) screening the protoplasts to determine whether the amount of gene expression of the preparter gene construct changes in response to the expression of the library members, a change in gene expression of the reporter gene construct identifying the gene product expressed by the library member as in that modulates expression of the gene of interest. The present sequence protocell kinase (CDPK) ATCDPRZ kinase domain.
                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          189

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5, A Sequence 4, A

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Calcium-dependent protein kinase (EC 2.7.1.-) CDPK - pumpkin
NyAlternate names: calcium-dependent calmodulin-independent protein kinase CDPK
(Specias: Cucurbita pepo (pumpkin)
C;Date: 16-Jul-1999 #sequence_revision 16-Jul-1999 #text_change 21-Jul-2000
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
C;Accession: T09940
A;Ritle: Cloning, expression and N-terminal myristoylation of CpCPK1, a calcium-depende
A;Recerace number: 216898; MUID:99178773; PMID:10080688
A;Accession: T09940
A;Status: preliminary; translated from GB/EMBL/DDBJ

A; Description: probably involved in pathogen defense in maize plants
C; Superfamily: calcium-dependent protein kinase; calmodulin repeat homology; protein kinase; C; Keywords: ATP; calcium-binding; EP hand; phosphotransferase; serine/threonine-specific p; 151-411/Domain: protein kinase homology «KIN»
F; 151-411/Domain: protein kinase ATP-binding motif F; 454-486/Domain: calmodulin repeat homology «EFI»
F; 450-522/Domain: calmodulin repeat homology «EFI»
F; 550-522/Domain: calmodulin repeat homology «EFI»
                                                                                                                                                                                                                                                                                             C;Accession: T02784
R;Muxillo, I.; Jaeck, E.; Cordero, M.; San Segundo, B.
